So what can you do with a Civil Engineering Degree? If more traditional design jobs or construction management paths are not career paths for you, think outside the box...think Forensics! Forensic engineering is a unique and challenging field that requires you as an engineer to investigate a failure and determine the best solution to “fix” the problem at hand. At Wiss, Janney, Elstner Associates, Inc. (WJE) we are engineers, architects and material scientists that work together to investigate and provide innovative solutions to solve unique problems – we provide “Solutions for the Built World.” Several case studies will be provided to highlight WJE’s involvement in structural failure investigations, unique historic restorations and failure prevention projects, including our recent assessment of the Washington Monument.
